TITLE: Investigating the properties of an electrokinetic diaphragm converter

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Priboro-stroyeniye, v. 5, no. 3, 1962; 43-52

TEXT: The author gives the results of an analytical investigation of the converter operating at a variable pressure in the range of frequencies not exceeding medium frequencies of sound. The paper is a continuation of previous ones by the author. The converter under the above conditions can be regarded as a symmetrical passive linear electrohydrodynamical four-terminal network. It is concluded that the frequency dependence of the sensitivity of the converter in the above range has a flat form, if the operating range of frequencies does not exceed the upper frequency limit of the converter. The amplitude characteristic has a linear form in a wide range of pressures, if deformation of the diaphragm in the domain

TITLE:

Experimental investigation of the electrokinetical membrane transducer

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Priborostroyeniye, v. 5, no. 4, 1962, 17-21

TEXT:

The results of a theoretical analysis by the same author (Izv. vuzov SSSR, Priborostroyeniye, v. 5, no. 3, 1962 and Izv. Akad. Nauk Azerb. SSR, no. 6, 1961) are verified experimentally by the use of acoustical techniques. Sample transducers of micarta or organic glass, having 40-60 mm external diameter, 12-35 mm height, 14-36 mm working diameter of the membranes, 2-7 mm height of the working chamber, distilled water as the working fluid, diaphragm of porous porcelain or glass, and clamped or glued membranes, have been tested over the sonic frequency spectrum. The frequency response is practically flat for finely porous diaphragm; the output voltage is a linear function of the alternating input pressure over wide ranges

Electrical measurements of nonelectrical quantities. Devices for automatic control and regulation in industry). Novosibirsk, Redizdat Sib. otd. AN SSSR, 1964, 86-92

TOPIC TAGS: electrokinetic transducer

ABSTRACT: The principle, operation, and elementary theory of the kinetic transducer are given (M. Williams, Rev. Sc. Instr., v. 19, no. 10, 1948;

Card 1/2

L 1950-66

ACCESSION NR: AT5017387

E. V. Hardway, Instruments, v. 26, no. 8, 1953). Experimental studies (Soviet, Western?) of transducers that included distilled water, acetone, acetonitrol, ethyl alcohol, hydrogen peroxide, and their mixtures in combinations with porous-porcelain and porous-glass diaphragms are mentioned. Advantages of the kinetic transducer are: (1) Flat frequency characteristic within 1 cps to ultrasonic frequencies; (2) Fairly high sensitivity, up to 55  $\mu$ v/bar; (3) Linear amplitude characteristic in a broad range of pressures; (4) Fairly low output resistance, 2 kohms or lower; (5) Simplicity and low cost of manufacture. Insufficient stability is cited as the principal disadvantage of these transducers. Possible applications listed are: measuring of variable pressures, vibrometers, accelerometers, acoustic receivers; measuring of purity, viscosity, concentration of materials. Orig. art. has: 4 figures and 14 formulas.

TITLE: On the investigation of electrokinetic converters at low and infralow frequencies

SOURCE: AN AzerbSSR. Ivestiya. Seriya fiziko-tekhnicheskikh i matematicheskikh nauk, no. 2, 1965, 97-104

TOPIC TAGS: acoustic measurement, pressure measurement, electric measurement, electromechanic converter, electroacoustics

ABSTRACT: The article deals with an experimental setup for the investigation of electrokinetic converters at low and infralow frequencies and relatively low pressures. The apparatus was developed at Energeticheskii institut Azerbaydzhanskoy SSR (Power Engineering Institute, Azerbaydzhan SSR). Its operation is based on a comparison of the tested converter with a standard calibrated pressure receiver, in this case a barium-titanate piezoceramic converter. The apparatus is capable of producing pressures up to 1200 bar at frequencies of 0.1-100 cps. The operation of the equipment and the test procedure are described. Some practical operating hints aimed at improving accuracy are also mentioned. The piezoelectric receiver was found to be linear up to about 38 v, beyond which the pressure wave-

Card 1/2

form became distorted. Plots of the frequency dependence of the pressure in the chamber with and without the measured converter are presented, as well as the dependence of the pressure on the applied voltage. It is stated in the conclusion that the apparatus can be used not only for electrokinetic but also for other measuring converters with sufficient acoustic rigidity. Orig. art. has: 5 figures. [02]

TITLE: Experimental installation for investigation of electrokinetic transducers in the audio-frequency range

SOURCE: Za tekhnicheskoy progress, no. 2, 1966, 18-21

TOPIC TAGS: acoustoelectric transducer, acoustic measurement

ABSTRACT: An experimental setup for electroacoustic measurements is described. A block diagram is shown in Fig. 1. The setup consists of a 70 x 70 x 70 cm steel container lined on the inside with a foam rubber pad 14 mm thick for sound absorption. The container is filled with water. The sound radiator on the left is a corrugated steel disk (diameter, 100 mm; thickness, 0.2 mm) with a piston rod driven by a EDV-8 vibrator, which in turn is driven by an audio oscillator through a TU-100 power amplifier. The maximum force developed by the vibrator is 23.54 n, producing a displacement of ±2 mm in the frequency range of 30—14,000 cps. The right side of the acoustic chamber holds a Ti-Ba hydrophone 20 mm in diameter and 15 mm high. It has a flat frequency response in the band extending from 20 to 12,000 cps and sensitivity of 40 μv/n/m<sup>2</sup>. Next to it is the electroacoustic transducer undergoing testing. Switch K allows the hydrophone or electroacoustic trans-

TITLE: Frequency characteristics of an electrokinetic seismic pressure receiver

SOURCE: AN AzerbSSR. Investiya. Seriya fiziko-tehnicheskikh i matematicheskikh nauk, no. 3, 1965, 116-122

TOPIC TAGS: seismic prospecting, pressure transducer, frequency characteristic

ABSTRACT: The principle of operation and essential parts of an electrokinetic transducer suitable for functioning as a pressure receiver in seismic prospecting for petroleum in the sea were described in an earlier authors' article (Izv. AN AzerbSSR, Series of phys., math., and techn. sciences, no. 1, 1965). The present article reports the results of an investigation of the transducer operation at variable pressures and of its characteristics. A formula developed for the alternating flow potential shows that this potential depends not only on the physico-chemical properties

Card 1/2

L 27686-66

ACC NR: AF6005614

of the porous-diaphragm-liquid system but also on the frequency and amplitude of applied pressure, and on hydrodynamic and mechanical parameters of the transducer. Also, formulas for the transducer output voltage and its frequency-dependent sensitivity at low and infralow frequencies are developed. An experimental microvolt-per-bar vs. frequency (0-3 cps) curve corroborates the theoretical results. The new transducer is recommended for 1-f (3-40 cps) seismic prospecting, particularly with depth seismic probing. Orig. art. has: 4 figures and 17 formulas.

TITLE: An electrokinetic transducer of mechanical oscillations. Class 42, No. 187331

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 129-130

TOPIC TAGS: piezoelectric transducer, mechanical vibration

ABSTRACT: This Author's Certificate introduces an electrokinetic transducer of mechanical oscillations. The unit consists of a housing containing a porous partition, elastic diaphragms, electrodes and working fluid. The spectrum of mechanical oscillations is analyzed by making half the cavity of the housing in the form of chambers, each equipped with its own porous partition which isolates a definite frequency band. Each chamber also has an electrode which is paired with an electrode common to all the chambers to form a signal output network.

TITLE: Capacitance transducer-micromanometer

SOURCE: Avtometriya, no. 5, 1966, 71-75

TOPIC TAGS: pressure transducer, manometer, variable capacitor, electrolytic capacitor

ABSTRACT:

A transducer designed to measure small pressures is described which converts small pressure changes into capacitance changes that can be measured electronically. The transducer (see Fig. 1) consists of a U-shaped glass tube, each of whose legs contains metallic rods coated with Plexiglas. Two cylindrical channels are formed between the walls of the tube and the rods. The channels are half-filled with a 5% solution of sodium chloride which serves as an electrolyte. The surface of the liquid is covered with a thin layer (0.1—0.3 mm) of kerosene. A stainless steel electrode, which makes contact with the electrolyte, is inserted into the bent portion of the tube. In this manner, two variable capacitors ( $C_1$  and  $C_2$ ), connected in series by the electrolyte, are formed. The fixed metallic rod serves as a fixed inner electrode, the Plexiglas layer as the insulator, and the

electrolyte, whose height varies with pressure, as the second electrode of each capacitor. The stainless steel electrode in contact with the movable capacitor electrode of both capacitors, and contacts to the ends of the two metallic rods (the inside capacitor electrodes) are used to connect the transducer to the measuring circuits. Changes in the liquid level in the arms of the glass tube caused by pressure changes are converted into capacitance changes that are measured electronically. Transducers which achieve an accuracy of about 3% and have reactive components (for each arm) of 126 kohm at 30 kc have been produced. The level of the kerosene layer on top of the working liquid can be recorded automatically. Orig. art. has: 2 figures and 2 formulas. [WA-75] [IV]

Title : Various forms of the equations of motion of viscous-plastic liquids and the law of hydrodynamic similarity

Periodical : Prikl. Mat. i Mekh., 19, 348-352, May-June 1955

Abstract : The author states that for the determination of hydraulic resistances in the motion of viscous-plastic liquids (clayey solution, cement solution, peat hydromass) and for the derivation of dimensionless parameters, the basic differential equations of motion are necessary. These equations are derived and are found to be dependent upon the Laplacian operator. The author shows how the various dimensionless parameters can be derived from the equations.

TITLE: The Laminar-flow Motion in Sequence of Two Viscous Fluids in a Pipe Line (Posledovatel'noye dvizheniye dvukh vyazkikh zhidkostey v trube pri laminarnom rezhime dvizheniya)

PERIODICAL: Tr. Azerb. n.-i. in-t po dobyche nefti, 1957, Nr 6, pp 5-19

ABSTRACT: An approximate solution is provided for the problem of the motion in sequence of two viscous fluids, under laminar flow conditions, through circular cylindrical pipes, both horizontal and vertical. The gravitational forces and the local distortions of the velocity field in the zone of the interface between the two liquids are disregarded. At the moment of the arrival of the driving fluid at the terminal section of a horizontal pipe line the ratio of the volume of the driven fluid remaining therein,  $\Delta W$ , to the volume originally contained therein,  $W$ , varies within the limits  $\Delta W/W = -1/3-2/3$ , depending on the ratio of the viscosities of the two fluids. In a motion in sequence either upward or downward the value of  $\Delta W/W$  depends on the ratio of the densities

Title : The Feeding of the Dragon Fly Larva Anax imperator Leach

Orig Pub: Izv. AN AzerbSSR, 1956, No 11, 91-97

Abstract: The larvae A. imperator feed themselves on oligochaetes, the larvae of tendipedidae and of other insects, on tadpoles, frogs, fry of vimba and herring, on the spawn of vimba and on ostracoda; ticks, ordinary mites (Arcello) and green seaweeds were also found in their intestines. During the experiments, the dragon fly larva ate 4.3 - 22 oligochaetes weighing 0.017 - 0.11 grams, or 16 - 39 tendipedidae larvae weighing 0.06 - 0.13 g., or 32 - 66 fry of vimba

TITLE: Jet-type generator. Class 42, No. 168116 [announced by Institute of Automation and Telemechanics (Engineering Cybernetics) AN SSSR (Institut avtomatiki i telemekhaniki (tekhnicheskoy kibernetiki) AN SSSR)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 16, 1966, 109

TOPIC TAGS: jet type generator, frequency stability, oscillatory system

ABSTRACT: The jet-type generator of pressure oscillation proposed in the certificate contains a mechanical oscillatory system, a jet interrupter, two feed-back nozzles, amplifiers, and triggers. In order to improve the stability of the generated frequency, the balance wheel of the mechanical oscillatory system is coupled with the flapper of the interrupter. The receiving nozzle of the latter is connected with the control channel of the amplifying element. The two mutually

TITLE: Comparison of reliable remote-control systems and the law of distribution of the number of inquiries from a remote-control system with decentralized objects

SOURCE: AN AzerbSSR. Izvestiya. Seriya fiziko-tekhnicheskikh i matematicheskikh nauk, no. 1, 1966, 63-70

TOPIC TAGS: remote control system, information processing, statistic distribution, entropy, communication channel

ABSTRACT: The author solves the problem of finding the law governing the distribution of the number of bits of information arriving within a time  $t$  from given  $n$  objects, each of which has a probability  $P_m$  ( $m$  is the serial number of the object) of receiving a bit of information, independently of the other object. The problem is considered for several practical cases, in which the probabilities  $p$  for all objects are equal, the probabilities for the objects have a normal or Poisson distribution, and the probabilities on the objects have other specified probabilities. The solution is based on standard statistics with evaluation of the entropy of the entire remote control system with respect to the reliability of rival information, the entropy of the distribution of number of rivals of bits of information at the individual objects, the entropy of the apparatus at the dispatching center, and the entropy of the communi-

TITLE: Rules governing the flow of films in a vertical cylindrical tube

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, v. 5, no. 4, 1962, 71 - 74

TEXT: The stationary flow of single and two-phase viscous films under the effect of the force of gravity is studied. It is found that the film thickness increases with the path of flow. Consequently, the mean velocity of the liquid decreases. The problem is dealt with by two different methods: (1) by assuming that the velocity profile is parabolic over the film thickness, and (2) without simplifications. In the former case, the function  $\delta = f(x)$ , i.e., the increase of the film thickness, is given as a function of the path of flow with reference to V. G. Levich (Ref. 9: Fiziko-khimicheskaya gidrodinamika (Physicochemical Hydrodynamics), Fizmatgiz, 1959). It is a complex rational function linear in first approximation. In the latter case, the solutions of the Navier Stokes equation and of the continuity equation  $v_x$  and  $v_y$  are expanded in power

series and broken off after the fourth term. The formulas show that both single and two-phase flows have only an approximately parabolic velocity profile. The solutions obtained agree with the experiments by H. Brauer (Ref. 3: VDJ, Forschungsheft 457, 22, 17, 1956) and Th. Sexauer (Ref. 4: Forschungs, 10, H.6, 295, 1954). There are 10 references: 3 Soviet and 7 non-Soviet. The three references to English-language publications read as follows: A. E. Dukler, O. P. Bergelin, Chem. Engin. Progr., no. 11, 1952; A. E. Dukler, Chem. Engin. Progr., no. 10, 1959; I. W. Dunning et al. US Patent 277924.
